Chapter 15 Siemens FC and FB Programming

Revisit the Binary Addition/Binary Subtraction lab from chapter 8 to subtract one 16 bit word from another and put the 16 bit result in a third word using a function and using the Siemens TIA software.

Remember:

0 + 0 = 0 0 + 1 = 1 1 + 0 = 1 1 + 1 = 0 carry 1 1 + 0 + carry = 0 carry 1 1 + 1 + carry = 1 carry 1

These are the rules for binary addition.

To see binary addition at work:

Carry				1	1	1	1				
Number 1	0	1	0	0	1	1	0	1	1	0	0
+ Number 2	0	1	0	1	1	0	1	1	0	1	0
Results	1	0	1	0	1	0	0	0	1	1	0

Binary addition may take place in ladder logic. Instructions are provided to carry out this function (ADD), but it is worthwhile to examine the process of binary addition using ladder logic

Since Bit 0 does not have a *carry_in*, half-adder logic may be employed but only for this bit. It can be seen that half-adder logic is simpler than full-add logic by comparing Chapter 8's Fig. 8-35 (Half-Adder) to Fig. 8-36 (Full Adder).

	CARY IN Bit7	CARY IN Bit6	CARY IN Bit5	CARY IN Bit4	CARY IN Bit3	CARY IN Bit2	CARY IN Bit1		CARYIN
	BYT0 Bit7	BYT0 Bit6	BYT0 Bit5	BYT0 Bit4	BYT0 Bit3	BYT0 Bit2	BYT0 Bit1	BYT0 Bit0	BYT_0
_	BYT1 Bit7	BYT1 Bit6	BYT1 Bit5	BYT1 Bit4	BYT1 Bit3	BYT1 Bit2	BYT1 Bit1	BYT1 Bit0	BYT_1
-	RSLT Bit7	RSLT Bit6	RSLT Bit5	RSLT Bit4	RSLT Bit3	RSLT Bit2	RSLT Bit1	RSLT Bit0	- RSLT

Accessing Bits in Words (Siemens)

Examples

	LAD	FBD	SCL	
Bit sccess	"DW":x11	'D₩".×11	IF "DW".×11 THEN END_IF;	
Byte access	'DW".b2 == Byte 'DW".b3		IF "DW".b2 = "DW".b3 THEN END_IF;	
Word access	AND Word "DW".w0 IN1 OUT "DW".w1 IN2 \$	AND Word "DW".w0 IN1 OUT- "DW".w1 IN2 \$ EN0-	out:= "DW".w0 AND "DW".w1;	

In the PLC tag table, "DW" is a declared tag of type DWORD. The examples show bit, byte, and word slice access:

Complete the lab using a function instead of coding each network as separate logic.

Binary Subtraction:

To perform binary subtraction, the easiest method is to find the 2's complement of the second number and then add the two numbers.

The best method of finding the 2's complement requires the use of a memory bit. The rule requires that bits from the original number be copied to the 2's complement number starting at the right-most bit. The rule applies until a "1" is encountered. The first "1" is copied but a memory bit is set after which the bits are "flipped". Try this rule. It works and may be employed using ladder logic and a Latch bit to quickly find the 2's complement of a number. The logic for finding the 2's complement of a number in ladder logic is begun in Fig. 8-37. Again, logic must be added to complete the function using rungs similar to rungs 4 and 5 of this figure but using bits 2 through15.

Again, code the logic using a function.

То	build a	function,	add a i	new blocl	k in the	TIA	software:
----	---------	-----------	---------	-----------	----------	-----	-----------

Add new block			_			×
Program press						
	Language:	FBD		<u> </u>		
	Number:	1	*			
Organization		🕘 Manual				
(OB)		 Automat 	ic			
		🗸 Symbolic	c access (only		
E 🛛 –	Description:					
Function block (FB)	Functions are cod	e blocks or subrou	itines wit	hout dedicat	ted memory.	
Function (FC)						
Data block (DB)	more					
Further inform	ation					
✔ Add new and op	en				ок	Cancel

The block Program Press [FC1] will be opened automatically. However, before the program can be written, the block's interface has to be declared. When the interface is declared, the local variables known only in this block are specified.

The variables consist of two groups

• Block parameters that generate the interface of the block for the call in the program.

Туре	Name	Function	Available in
Input parameters	Input	Parameters whose values the block reads	Functions, function blocks and some types of organization blocks
Output parameters	Output	Parameters whose values the block writes	Functions and function blocks
InOut parameters	InOut	Parameters whose value the block reads when it is called and after processing,	Functions and function blocks

writes again to the same parameter

Local data that is used for storing intermediate results:

Туре	Name	Function	Available in
Temporary local data	Temp	Variables that are used for storing temporary intermediate results. Temporary data is retained for one cycle only.	Functions, function blocks and organization blocks
Static local data	Static	Variables that are used for storing static intermediate results in the instance data block. Static data is retained also over several cycles, until it is written anew.	Function blocks

Use a Watch Table to view and change the data. See several examples in videos such as:
